This is the clean list: no thin-sample ($n < 3$) picks, no sub-70% win rates — every stock here is both reasonably proven and a strong historical performer. Most still rely on 2019-2025 F&O futures history (4-7 years), not a full multi-decade record.

Caveat: best-direction-per-stock selection has repeatedly underperformed a uniform index-backed direction out-of-sample in this project's prior testing.

Methodology — How Each Measure Is Calculated

MEASURE	LOGIC	FORMULA
Window & event	Each stock has its own T-n/T+m trading-day window around the 20-Oct-2026 Dussehra anchor, on the NSE-2026 calendar.	$Entry = anchor - n \text{ trading days}$; $Exit = anchor + m \text{ trading days}$.
Split-robust return	Daily % changes inside the window are compounded; any single-day move $> 20\%$ (stock split/bonus artifact) is skipped.	$year_return = (\prod (1 + daily_ \%)), \text{ skip } daily_ \% > 20\% - 1, \times 100$.
Direction (LONG/SHORT)	Both directions backtested on the same yearly moves; the one with the higher win rate across all years is chosen per stock.	$Chosen = direction \text{ with } \max(LONG \text{ win}\%, SHORT \text{ win}\%)$.

MEASURE	LOGIC	FORMULA
Win Rate %%	Share of years the chosen direction was profitable.	$\text{winning years} \div \text{total years with data} \times 100.$
Avg Return %%	Simple average of the signed yearly returns.	$\text{mean}(\text{signed yearly returns}).$
CAGR %%	Compounded annual growth if only this one trade/year were reinvested year over year — rewards consistency over lucky one-offs.	$(\prod(1+r/100))^{(1/n)} - 1, \times 100.$
Max Drawdown %%	Peak-to-trough decline on the cumulative equity curve of the yearly trades (trade-level, not intraday).	$\text{min}((\text{equity}_t - \text{running_peak}) \div \text{running_peak}) \times 100.$
Sharpe-like	Risk-adjusted return vs. year-to-year variability; NOT annualized — only compare within this report.	$\text{mean}(\text{yearly returns}) \div \text{population_stdev}(\text{yearly returns}).$
Confidence & this report's filter	OK = ≥ 3 years of data (LOW excluded entirely here). This report keeps only Confidence=OK AND Win Rate $\geq 70\%$ %, ranks by avg return, shows the top 50.	<i>59 stocks pass the filter → top 50 by avg_return shown.</i>

Upcoming 20-Oct-2026 entry/exit schedule for every stock here is in the companion Excel, Position_Schedule_2026 sheet. Full formula detail is in the Excel's Methodology sheet.
